Operating mode:

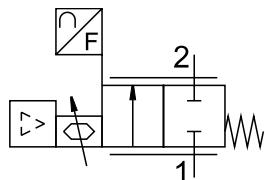

- The VEMD is a mass flow controller with integrated proportional valve. The flow rate is controlled using a closed loop control with integrated thermal sensor.
- The setpoint value for the flow rate can be specified using an analogue or digital interface, and the actual value is reported back in the same way.

Range of applications:

- The proportional flow control valve VEMD is intended to control a flow of air and inert gases proportionally to a specified setpoint value.
- The flow control valve is suitable for use in medical technology within the specified technical characteristics.
- Additional measures, for example with regard to hygiene and sterility, may be required for applications with special requirements.
